Chapter 15

VAN DER WAALS AREA AND VOLUME – ORGANIC COMPOUNDS

Carl L. Yaws and Aisha S. Y. Leh
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 15. The tabulation is arranged by carbon number (C, C2, C3, ...) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for van der Waals area and volume are given in the adjacent columns.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-7). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of Daubert and Danner (3) and Yaws (6-7) were used extensively. Van der Waals area and volume involve the surface area and volume of an atom and maybe ascertained from bond distances, contact distances and shapes of atoms. Methods of calculation are described by Bondi (1).

Example

In an engineering analysis, van der Waals area and volume are needed for carbon tetrachloride (CCl4). Determine van der Waals area and volume for carbon tetrachloride.

Inspection of the tabulation yields:

area = 7.280E+09 cm^2/mol

volume = 52.300 cm^3/mol

Chapter 16

VAN DER WAALS AREA AND VOLUME – INORGANIC COMPOUNDS

Carl L. Yaws and Aisha S. Y. Leh
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 16. The tabulation is arranged by alphabetical order (Ag, Al, Ar, ..., Zr) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for van der Waals area and volume are given in the adjacent columns.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-4). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of Daubert and Danner (2) and Yaws (3-4) were used extensively. Van der Waals area and volume involve the surface area and volume of an atom and maybe ascertained from bond distances, contact distances and shapes of atoms. Methods of calculation are described by Bondi (1).

Example

In an engineering analysis, van der Waals area and volume are needed for silicon tetrachloride (SiCl4). Determine van der Waals area and volume for silicon tetrachloride.

Inspection of the tabulation yields:

area = 7.830E+09 cm^2/mol

volume = 60.820 cm^3/mol

Chapter 17

RADIUS OF GYRATION – ORGANIC COMPOUNDS

Carl L. Yaws and Aisha S. Y. Leh
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 17. The tabulation is arranged by carbon number (C, C2, C3, ...) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for radius of gyration are given in the adjacent column.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-5). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of Daubert and Danner (1) and Yaws (4-5) were used extensively. The radius of gyration is a helpful indication of the size of a compound. It is ascertained from the moment of inertia and molecular weight. Applications and methods of calculation are described by Wikipedia (3).

Example

In an engineering analysis, the radius of gyration is needed for carbon tetrachloride (CCl4). Determine the radius of gyration for carbon tetrachloride.

Inspection of the tabulation yields:

radius of gyration = 3.482 Angstrom

Chapter 18

RADIUS OF GYRATION – INORGANIC COMPOUNDS

Carl L. Yaws and Prashant Bahadur
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 18. The tabulation is arranged by alphabetical order (Ag, Al, Ar, ..., Zr) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for radius of gyration are given in the adjacent column.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-5). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of Daubert and Danner (1) and Yaws (4-5) were used extensively. The radius of gyration is a helpful indication of the size of a compound. It is ascertained from the moment of inertia and molecular weight. Methods of calculation are described by Wikipedia (3).

Example

In an engineering analysis, the radius of gyration is needed for silicon tetrachloride (SiCl4). Determine the radius of gyration for silicon tetrachloride.

Inspection of the tabulation yields:

radius of gyration = 3.770 Angstrom

Chapter 19

DIPOLE MOMENT – ORGANIC COMPOUNDS

Carl L. Yaws and Prasad K. Narasimhan*
Lamar University, Beaumont, Texas / *Invensys Process Systems, Houston, Texas

Tabulation Results

The results are given in Table 19. The tabulation is arranged by carbon number (C, C2, C3, ...) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. The state of compound and value of dipole moment are given in the adjacent columns. The last column provides the code for the tabulation.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-17). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (2), Daubert and Danner (3), Landolt and Bornstein (6), and Yaws (16-17) were used extensively for the tabulation. Estimates were primarily based on the method of Abraham and Smith (4). The dipole moment which involves the first moment of the electric charge density of the compound is used in property correlations for polar compounds.

Example

In an engineering analysis, the dipole moment is needed for chloroform (CHCl3). Determine the dipole moment for chloroform.

Inspection of the tabulation yields:

dipole moment = 1.010 Debye

Chapter 20

DIPOLE MOMENT – INORGANIC COMPOUNDS

Carl L. Yaws and Marco A. Satyro*
Lamar University, Beaumont, Texas / *Virtual Materials Group, Calgary, Alberta

Tabulation Results

The results are given in Table 20. The tabulation is arranged by alphabetical order (Ag, Al, Ar, ..., Zr) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. The state of compound and value of dipole moment are given in the adjacent columns. The last column provides the code for the tabulation.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-17). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (2), Daubert and Danner (3), Landolt and Bornstein (6), and Yaws (16-17) were used extensively for the tabulation. The dipole moment which involves the first moment of the electric charge density of the compound is used in property correlations for polar compounds.

Example

In an engineering analysis, the dipole moment is needed for carbon monoxide (CO). Determine the dipole moment for carbon monoxide .

Inspection of the tabulation yields:

dipole moment = 0.112 Debye

Chapter 21

SURFACE TENSION – ORGANIC COMPOUNDS

Carl L. Yaws and Peyton C. Richmond
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 21. For the tabulation, a modified Othmer relation was selected for correlation of surface tension as a function of temperature:

$$\text{sigma} = A\,(1 - T/B)^{n} \qquad (21)$$

where sigma = surface tension, dynes/cm
A, B, and n = regression coefficients for chemical compound
T = temperature, K

The tabulation is arranged by carbon number (C, C2, C3, ...) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for regression coefficients are given in the adjacent columns. The temperature range for use is given in the next columns (TMIN and TMAX). The equation should not be used for temperatures outside this range. The next column provides the code for the tabulation. The last two columns provide a representative temperature and value for surface tension at the representative temperature.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-36). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2), Daubert and Danner (3), Jasper (7), and Yaws (17-35) were used extensively. Estimates were primarily based on the Sugden method (12); Brock and Bird correlation (12); and Sastri and Rao method (12). Experimental data and estimates were then regressed to provide the same equation for all compounds.

A comparison of calculated and data values is shown in Figure 21 for a representative compound. The graph shows favorable agreement of equation and data.

Example

In an engineering analysis, the surface tension is needed for chlorobenzene (C6H5Cl) at 343.15 K. Determine the surface tension of chlorobenzene at this temperature.

Substitution of the coefficients from the tabulation and temperature into the above equation yields:

$$\text{surface tension} = 72.700\,(1-343.15/632.35)^{1.2420}$$

surface tension = 27.51 dynes/cm

Table 21 Surface Tension - Organic Compounds

			sigma = A (1 - T/B)^n				(sigma - dynes/cm, T - K)				
ID	FORMULA	NAME	CAS No	A	B	n	TMIN	TMAX	code	T	sigma @ T
code: 1 - data, 2 - estimate											
sigma - surface tension, dynes/cm											
A, B, and n - regression coefficients of chemical compound											
T- temperature, K											
TMAX - maximum temperature, K											
TMIN - minimum temperature, K											

Chapter 22

SURFACE TENSION – INORGANIC COMPOUNDS

Carl L. Yaws and Peyton C. Richmond
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 22. For the tabulation, a modified Othmer relation was selected for correlation of surface tension as a function of temperature:

$$\text{sigma} = A\,(1 - T/B)^n \qquad (22)$$

where sigma = surface tension, dynes/cm
A, B, and n = regression coefficients for chemical compound
T = temperature, K

The tabulation is arranged by alphabetical order (Ag, Al, Ar, ..., Zr) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for regression coefficients are given in the adjacent columns. The temperature range for use is given in the next columns (TMIN and TMAX). The equation should not be used for temperatures outside this range. The next column provides the code for the tabulation. The last two columns provide a representative temperature and value for surface tension at the representative temperature.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-38). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (3-4); Daubert and Danner (6); Jasper (13); Keene (16); Lu and Jiang (19); Mills and Su (21); and Yaws (35-38) were used extensively. The reviews of Keene (16) and Mills and Su (21) were especially valuable and helpful for the metals. The review of Jasper (13) was especially valuable and helpful for gases and liquids. Estimates were primarily based on the Sugden method (24-25). Experimental data and estimates were then regressed to provide the same equation for all compounds.

A comparison of calculated and data values is shown in Figure 22 for a representative compound. The graph shows favorable agreement of equation and data.

Example

In an engineering analysis, the surface tension is needed for xenon (Xe) at 215 K. Determine the surface tension of xenon at this temperature.

Substitution of the coefficients from the tabulation and temperature into the above equation yields:

$$\text{surface tension} = 54.300\,(1-215.0/289.74)^{1.2829}$$

surface tension = 9.55 dynes/cm

Conversion Table

1. **Temperature**
   To convert from Centigrade to:
   Kelvin, add 273.15
   Rankine, multiply Kelvin by 1.8
   Fahrenheit, multiply Centigrade by 1.8 and add 32

2. **Pressure**
   To convert from psia to:
   kPa, multiply by 6.895
   psig, subtract 14.7
   mm Hg, multiply by 51.71
   atmospheres, divide by 14.7
   bars, divide by 14.508

3. **Heat of Vaporization**
   To convert from kj/kg to:
   BTU/lb, multiply by 0.43
   cal/gram, multiply by 0.239

4. **Density**
   To convert from g/ml to:
   lb/ft^3, multiply by 62.43
   lb/gallon, multiply by 8.345

5. **Surface Tension**
   To convert from dynes/cm to:
   N/m, multiply by 0.001

6. **Heat Capacity**
   To convert from j/g K to:
   BTU/lb R, multiply by 0.239
   cal/gram K, multiply by 0.239

7. **Viscosity**
   To convert from micropoise to:
   lb/ft s, multiply by 0.0672E-06
   centipoise, multiply by 1.0E-04
   poise, multiply by 1.0E-06
   Pa s (Pascal seconds), multiply by 1.0E-07

   To convert from centipoise to:
   lb/ft s, multiply by 0.000672
   micropoise, multiply by 10,000
   poise, multiply by 0.01
   Pa s (Pascal seconds), multiply by 0.001

8. **Thermal Conductivity**
   To convert from W/m K to:
   BTU/hr ft R, multiply by 0.5770
   calorie/cm s K, multiply by .002388

9. **Enthalpy of Formation**
   To convert from kj/mol to:
   kcal/mol, multiply by 0.239

10. **Gibbs Energy of Formation**
    To convert from kj/mol to:
    kcal/mol, multiply by 0.239

11. **Henry's Law Constant for Compound in Water**
    To convert from atm/mol fraction to:
    atm/(mol/m^3), divide by 55,556
    kPa/(mol/m^3), divide by 548.295

Thermophysical and Transport Properties of Water

Carl L. Yaws and Peyton C. Richmond
Lamar University, Beaumont, Texas

Abstract

Thermophysical and transport properties are presented for water. The results include physical constants, critical values, vapor pressure, density of liquid, enthalpy of vaporization, surface tension, heat capacity, viscosity, and thermal conductivity. Both gas and liquid are covered. The coefficients for property values as a function of temperature are provided in an easy to use tabular format.

Importance of Properties

Thermophysical and transport properties are important to engineers in chemical processing and petroleum refining. In vapor-liquid operations, such as distillation, knowledge of vapor pressure is required to determine K-values for the design. The design of storage and process vessels requires knowledge of the density of liquid in the vessels. In the design of condensers and vaporizers, knowledge of enthalpy of vaporization is required to ascertain the heat duties for the equipment. Knowledge of heat capacity is required for the design of heat exchangers. The design of piping systems requires knowledge of viscosity of the fluid flowing in the piping. Other applications involve environmental, green, safety, and simulation engineering.

Tabulation of Properties

The results are given in Table B. The initial entries in the table are physical and critical properties. This includes molecular weight, freezing point, boiling point, density, refractive index, and acentric factor for the physical properties. Critical temperature, pressure, volume, density, and compressibility factor are provided for the critical properties.

Subsequent entries in the table provide coverage for properties which vary with temperature. This includes vapor pressure, density of liquid, enthalpy of vaporization, surface tension, heat capacity, viscosity, and thermal conductivity. For the subsequent entries, regression coefficients (A, B, C, ...) are given for the temperature dependency. The range of application is denoted by minimum and maximum temperatures (TMIN and TMAX) in the adjacent columns. Temperatures outside the range of application should not be used. The next column provides the code for the tabulation which is based on both experimental data and estimated values. The last several columns provide representative values for the property. For gas, the table applies to gas at low pressure. For liquid, the table primarily applies to liquid at saturation.

The format for the tablulation is constructed for rapid usage. For each property, the equation showing the temperature dependency is given on the row for the property. The regression coefficients for use in the equation are provided in the adjacent rows. These displayed regression coefficients in the adjacent rows can be used for quick calculation of the property value at the temperature of interest.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-13). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of the values for the remaining compounds was performed. The numerous point values were processed using a computer program for minimum deviation.

The compilations of Beaton and Hewitt (1); CRC (2); Daubert and Danner (3); Perrys (7); and Yaws (11-13) were used extensively for the compilation. Estimates were primarily based on literature estimated values and proprietary techniques of the senior author.

A comparison of calculated and data values is shown in Figures B-1 to B-11 for representative properties. The graphs disclose favorable agreement of equation and data.

Example

In an engineering analysis, the liquid viscosity of water at 400 K is required. Calculate the liquid viscosity at this temperature.

Substitution of the coefficients from the table and temperature into the equation for liquid viscosity yields:

$$\log_{10} n_{liq} = A + B/T + C\,T + D\,T^2$$

$$= -11.6225 + 1.9490E+03/400 + 2.1641E-02*400 - 1.5990E-05*400^2 = -0.6519$$

$$n_{liq} = 10^{-0.6519} = 0.223 \text{ centipoise}$$

Thermophysical and Transport Properties of Air

Carl L. Yaws and Sy-Chyi Lin
Lamar University, Beaumont, Texas

Abstract

Thermophysical and transport properties are presented for air. The results include physical constants, critical values, saturation pressure, density of liquid, enthalpy of vaporization, surface tension, heat capacity, viscosity, and thermal conductivity. Both gas and liquid are covered. The coefficients for property values as a function of temperature are provided in an easy to use tabular format.

Tabulation of Properties

The results are given in Table C. The initial entries in the table are physical and critical properties. This includes molecular weight, freezing point, boiling point, density, refractive index, and acentric factor for the physical properties. Critical temperature, pressure, volume, density, and compressibility factor are provided for the critical properties.

Subsequent entries in the table provide coverage for properties which vary with temperature. This includes saturation pressure, density of liquid, enthalpy of vaporization, surface tension, heat capacity, viscosity, and thermal conductivity. For the subsequent entries, regression coefficients (A, B, C, ...) are given for the temperature dependency. The range of application is denoted by minimum and maximum temperatures (TMIN and TMAX) in the adjacent columns. Temperatures outside the range of application should not be used. The next column provides the code for the tabulation which is based on both experimental data and estimated values. The last several columns provide representative values for the property. For gas, the table applies to gas at low pressure. For liquid, the table primarily applies to liquid at saturation.

The format for the tablulation is constructed for rapid usage. For each property, the equation showing the temperature dependency is given on the row for the property. The regression coefficients for use in the equation are provided in the adjacent rows. These displayed regression coefficients in the adjacent rows can be used for quick calculation of the property value at the temperature of interest.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-12). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of the values for the remaining compounds was performed. The numerous point values were processed using a computer program for minimum deviation.

The compilations of Beaton and Hewitt (1); CRC (2); Daubert and Danner (3); and Perrys (8) were used extensively for the compilation. Estimates were primarily based on literature estimated values and proprietary techniques of the senior author.

A comparison of calculated and data values is shown in Figures C-1 to C-12 for representative properties. The graphs disclose favorable agreement of equation and data.

Example

In an engineering analysis, the liquid viscosity of air at 80 K is required. Calculate the liquid viscosity at this temperature.

Substitution of the coefficients from the table and temperature into the equation for liquid viscosity yields:

$$\log_{10} n_{liq} = A + B/T + C\,T + D\,T^2$$

$$= -3.1963 + 1.0982E{+}03/80 + 1.9485E{-}02*80 - 8.0902E{-}05*80^2 = -0.7825$$

$$n_{liq} = 10^{-0.7825} = 0.165 \text{ centipoise}$$
